McGraw-Hill's Q&A for Clerks Test

Cardiovascular Disorders > Acquired Heart Disease

Question 1 of 2

Close Window

Choose the one best response to this question.

A 57-year-old man has end-stage heart failure due to atherosclerosis. He

is first on the transplant list, and a donor becomes available. The harvest

team is dispatched. Which of the following statements regarding heart

transplantation is true?

A. Heart transplants are matched by size and ABO blood type rather than tissue typing.

B. Cadaveric graft survival is significantly lower with heart transplants as compared with renal transplants.

C. Cold ischemia time for donor hearts does not affect outcome.

D. The upper age limit for heart transplant eligibility is 55 years.

E. The leading cause of death after the first year of cardiac transplantation is chronic rejection.

Clerkship Corner

Textbooks, cases, and Q&A selected with medical students in mind.

There's more support for you to ace your wards on the Clerkship Corner. If you haven't already created a profile on the My AccessSurgery tab, sign up for your personal account and indicate that you are a medical student. Here's what you'll get access to:

- Textbook recommendations that are suited for medical students
- Cases to prepare you for surgical situations you are likely to handle
- Q&A created for clerks
- Content organized by Organ Systems and Core Topics, helping you prep for the USMLE Step 2 or your shelf exams
- Search results that give you clerk-recommended resources--but also display more advanced content for further reference
- Quick links to clerk resources from the homepage

Case Files Surgery, 3e

Eugene C. Toy, Terrence H. Liu, and Andre R. Campbell

Surgery: Pretest Self-Assessment and Review, 12e Lillian S. Kao and Tammy Lee

Lange Q&A: Surgery

C. Gene Cayten, Max Goldberg, Nanakram Agrawal, and Simon Wapnick

For Further Reading
